## Streetwear E-commerce Website - English Presentation Draft

### Purpose

This draft is prepared for the native speakers' review. It is written in clear English and can be corrected or improved during the lesson.

## 1. Project Overview

Good morning, today I am going to present my project called **VOID23**. VOID23 is a streetwear e-commerce website with a dark, minimal and modern design. The idea is to simulate a realistic online shop focused on urban fashion and alternative streetwear.

The website includes categories such as shoes, t-shirts, hoodies, caps and pants. The visual identity is inspired by dark streetwear aesthetics: simple colors, strong typography, clean sections and smooth animations.

## 2. Target Audience

The target audience is mainly young people between 16 and 30 years old who are interested in streetwear, urban culture and alternative fashion. The goal is to create a website that feels modern, direct and visually coherent with the brand identity.

## 3. Main Features

- user registration and login
- dynamic product catalogue connected to the database
- product categories: Shoes, T-Shirt, Hoodie, Cap and Pants
- search bar and price filters
- single product page with size selection
- shopping cart with quantity controls
- order saving and order history in the user profile
- dark interface with JavaScript animations

| Technologies Used                                                                                                                                                          | Database Structure                                                                                                                                                                                                                                                            |

# VOID23 - Speaking Notes

A clear version to read or use during the oral presentation

## Full presentation text

Good morning, today I am going to present my project called VOID23.

VOID23 is a streetwear e-commerce website. The main idea is to create an online shop with a dark, minimal and modern design. The website is focused on urban fashion and streetwear products such as shoes, t-shirts, hoodies, caps and pants.

The target audience is mainly young people between 16 and 30 years old who are interested in streetwear, alternative fashion and urban culture.

The website allows users to browse products, search items, filter them by category or price, add products to the cart and manage their account. Users can also register, log in and view their order history.

For the frontend, I used HTML, CSS and JavaScript. For the backend, I used PHP. For the database, I used MySQL, managed through phpMyAdmin and XAMPP.

The database contains different tables: users, products, categories, orders and order details. These tables are connected through relationships. For example, one user can have multiple orders, and each order can contain multiple products.

One of the most important parts of the project is the cart system. The user can add products to the cart, choose the size, change the quantity and see the total price.

I also used JavaScript animations to improve the user experience. The style of the website is dark and clean, in order to match the identity of the VOID23 brand.

During the development, I worked on different phases: project analysis, database design, frontend development, backend development, testing and documentation.

In conclusion, VOID23 is a dynamic e-commerce project that combines design, database management and backend programming. It helped me understand how a real online shop works and how different technologies work together.

# VOID23 - Quick Review Page

Short speaking version, vocabulary and correction notes

## Short version for speaking

*My project is called VOID23. It is a streetwear e-commerce website with a dark and minimal design. The website allows users to browse products, filter them, add them to the cart, register, log in and view their orders. I used HTML, CSS and JavaScript for the frontend, PHP for the backend and MySQL for the database. The goal of the project is to simulate a real online shop.*

## Useful vocabulary

| English            | Meaning                                 |
|--------------------|-----------------------------------------|
| e-commerce website | online shop / sito di commercio online  |
| shopping cart      | carrello                                |
| order history      | storico ordini                          |
| frontend           | visible part of the website             |
| backend            | server-side logic                       |
| database           | structured data storage                 |
| responsive layout  | layout that adapts to different screens |

## Questions for native speakers

- Can you help me make the presentation sound more natural?
- Are there any words that sound too technical or unnatural?
- Can we improve the final conclusion?
- Is the pronunciation of e-commerce, frontend and backend correct?
